Secure webhosting service started

BRATISLAVA, SLOVAKIA
FEBRUARY 6, 2006
(for immediate release)

Today was officially started new webhosting service built upon the priciples of active security.

Security experts associated with PLATON mark have prepared webhosting system, which fully satisfies the demanding requirements for stability, security and private data protection. All accesses to webhosting services are protected with asymetric encryption based on SSL. Even thought, their configuration is simple and straightforward, using existing tutorials it can be handled by every common non-technical computer user.

"For creation this service, we have been motivated by the fact, that the fundamental principles of secure communication are systematically ignored on the web-hosting market," explains Ondrej Jombik, Platon Group non-profit organization chairman and Platon Webhosting project manager.

Target group for secure web-hosting environment are especially companies and organisations with high necessity of personal data safety and serious security against discrediting their e-mail boxes or web presentation.

Platon Webhosting is a mutual project of the non-profit organization Platon Group and company Platon Technologies, Ltd.

Platon Group is Slovak open source software development group. They are developing, maintaining, documenting some successful open-source software projects.

Platon Technologies, Ltd. is young dynamically developed enterprise, which goal is to bring alternative software solutions based upon open technologies into the commercial sphere.
